OVERVIEW

- Main objective: To detect presence of melanoma using high resolution skin lesion images.
- Developing a deep learning model with the help of CNN.
- Utilizing various tools like Keras, TensorFlow, scikit, classifier etc to aid the process.
- Integrated with a user-friendly interface using android studio.

Develop deep learning model for detection of melanoma.

Create a user-friendly Android application.

Ability to capture or select skin cell images for real-time analysis.

Accurately classify different melanoma lesion types.

OBJECTIVES

OBJECTIVES ACHIEVED

Dataset Collection: Melanoma and non-melanoma images gathered.

Data Pre-processing: Resizing, normalizing and augmenting data.

Studying relationships between data.

Data Analysis: Studying factors like age, gender, localisation.

GRAPHS

As an example, given below are some graphs depicting the relationship between the data and different factors which affect it.

Fig. 1

Model Development								
Model Training								
App development								

CONCLUSION

In conclusion, we have made significant progress in our project up till the first week of September, in accordance to the timeline agreed upon.

Conducting various data analysis techniques on the data collected has made it possible to understand the relationships between the data in a deeper way.

As we move forward, we will integrate the model with an android application for seamless interaction.

THANK YOU
